

## **SUMMER TURN ON OUTDOOR WATER HOOK UP**

Tools Needed: 6' to 8' Black Shutoff Key  
30" Silver Drain Key  
Small Screwdriver

- 1) In the yard, using the 30" silver key close the \_\_\_\_\_ drains clockwise. These are located under the silver or yellow caps in a white pipe.
  
- 2) Go to the Back-Flow device and turn both the blue handles and the two test cocks 1/8 turn counter clockwise (See the following page for summer on proper positions). You will need a small flat head screwdriver to turn the test cocks.
  
- 3) Using the 6'-8' black T-handled key, you will open the main sprinkler valve. The turn-off is located under a small 6" round green lid in the yard (where we dug the large hole). There is another silver cap under the green lid. Insert the key in white pipe until it hits bottom. Turn key back and forth until it locks into position. Turn it a 1/4 turn counter clockwise until it stops. The water is now on. (You should not hear any water running at this time. If you do, repeat the turn on procedure until it stops. Never leave the system on if you hear running water.)
  
- 4) Go to controller and return the dial to the on position and run through each station. If you notice a problem or have a question please feel free to give us a call at the office.
